TuFFGrass

Weed Control Tips & Recipe

Weeds appearing in gardens, deco rock, bark mulch, pavers, concrete & asphalt can be easily controlled with safe & effective natural solutions.

Safer than applying chemical sprays, the following recipe is a common solution used by organic gardeners & farmers as a pre and post emergent.

Apply in fall and spring, or as needed. Germinated growth may take from 4 to 48 hours to die - then materials can be removed with a rake or leaf blower, for best results.

TIP - Remove dead growth by hand or use your grooming rake to remove dead growth and deeply agitate turf to remove dead materials

TuFFGrass Grooming Rake

Tools

Measuring cup
1+ gallon garden sprayer

Recipe

1 gallon of apple cider vinegar (full strength)
2 cups of epson salts
¼ cup of dish soap (except on turf*)

Add the ACV into the pressure sprayer, add the epson salts and shake to mix. Once the epson salts are dissolved, add the ¼ cup of dish soap.

*The dish soap is used to help the solution stick to rocks, pavers and materials such as mulch - **we do NOT recommend adding the dish soap and applying to the artificial grass surfaces** as it will coat the blades and may leave a film you will then want to rinse off.
